AAY32307

```
This is the nucleotide sequence of the CDNA insert in clone

rir72.pk0015.b2 encoding the entire rice acid triacylglycerol
lipase (TAGL) (see AAY23207). The clone was isolated from a rice
lapse (TAGL) (see AAY23207). The clone was isolated from a rice
lapse (TAGL) see AAY32301-17) and polynucleotides (see AAZ34950-66) from corn,

cate a prepared recombinantly and used to raise antibodies, which
are used for detecting the enzymes in situ in cells or in vitro in
cell extracts. The polynucleotides may be used to create transgenic
plants in which the TAGL levels are present at higher or lower levels
than normal, or in cell types or developmental processes where they are
not normally found. This would alter the level of triacylglycerol and
cholesteryl esters found in those cells. Accumulation of fatty acids
with unusual structures may be a positive phenotype in plants used for
foods. In addition, it may be desirable to eliminate expression of TAGL
genes for certain applications. TAGL enzymes may also be used of olis, the TAGL enzymes can also be used as targets to facilitate the
design and/or identification of inhibitors of those enzymes that may be
useful as herbicides. This is desirable because inhibition of plant
cells the polynucleotides also serve as a source of probes and
cell private the contains and to inhibitory of enters.

Correct the polynucleotides also serve as a source of probes or the correct of property.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                primers, which are useful for genetic mapping, as markers for traits
linked to those genes, and to isolate homologous sequences from other
          the
          to alter
plant triacylglycerol lipase polynucleotides used of the enzyme in transgenic plants \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                                                            δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of a contig assembled from a portion of the CDNA insert in clones p0075.cslag331, p0126.cnlay46r and p01014.ctuty54r encoding a substantial portion (see AAY133104) of corn acid triacy)glycerol lipase (TAGL). The clones were isolated from leaf and shoot libraries. Novel acid and neutral TAGL polypeptides (see AAY13301-17) and polynucleotides (see AAX134950-66) of enzymes may be brepared recombinantly and used to raise antibodies, which are used to detect the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides may be used to create transgenic plants in which the TAGL levels are present at higher or lower levels than normal, or in cell types or developmental processes where they are not normally found. This would alter the level of triacylglycerol and cholesteryl esters found in those cells. Accumulation of fatty acids with nousual structures may be desirable to eliminate expression of TAGL genes for certain applications. TAGL enzymes may also be useful for the development of novel seed olls and for the development of novel seed classing of plant seed oils and for the development of novel seed classing and/or identification of hibbitors of those enzymes that may be useful as herbicides. This is desirable because inhibition of the desirable accuse inhibition of the growth. The polynucleotides also serve as a source of probes and primes, which are useful for genetic mapping, as markers for traits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5;

This is the nucleotide sequence of a contig assembled from the entire cDNA insert in clone sre.pk0004.d7 and a portion of the cDNA insert in clones sls1c.pk009.02 and srr1c.pk001.m19 encoding the entire soybean cold triacy1g1ycerol lipses (TAGL) (see ANY32310). The clones were isolated from root and Sclerotinia sclerotiorum infected soybean cDNA libraries. Novel acid and neutral TAGL polypeptides (see ANY32301-17) and polynucleotides (see ANZ450-66) from corn, catalpa, rice, soybean and wheat tissues are disclosed. The enzymes may be prepared recombinantly and used to raise antibodies, which care used for detecting the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides may be used to create transgenic plants in which the TAGL levels are present at higher or lower levels than normal, or in cell types or developmental processes where they are not normally found. This would alter the level of triacy1g1ycerol and choiserery1 esters found in those cells. Accumulation of fatty acids with nursual structures may be desirable to eliminate expression of TAGL genes for cartain applications. TAGL enzymes may also be useful for the processing of plant seed oils and for the development of novel seed oils. The TAGL enzymes can also be used as targets to facilitate the useful as herbicides. This is desirable because inhibition of the structure of the enzymes could lead to an inhibition of the create activity of either of the enzymes could lead to an inhibition of plant process. The plynucleotides also serves as a source of probes and primers, which are useful for genetic mapping, as markers for traits in and the isolate homologous sequences from other and the could be and to isolate homologous sequences from other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              qq
                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of a contig assembled from the entire cDNA insert in clone ssl.pk0022.al and a portion of the cDNA insert in clone ssl.pk0022.al and a portion of the cDNA insert in clone sdp3c.pk004.n3 encoding the entire soybean acid triacylglycerol lipase (TAGL) (see AAY32309). The clones were isolated from soybean developing pod and seedling (5-10 day post germination) cDNA libraries. Novel acid and neutral TAGL polypeptides (see AAY32301-17) and polynucleotides (see AAZ34950-66) from corn, catalpa. rice, soybean and wheat tissues are disclosed. The enzymes may be prepared recombinantly and used to raise antibodies, which are used for detecting the enzymes in situ in cells or in vitro in cell extracts. The polynucleotides may be used to create transgenic plants in which the TAGL levels are present at higher or lower levels than normally out in cell types or developmental processes where they are not normally found. This would alter the level of triacylglycerol and cholesteryl esters found in those cells. Accumulation of fatty acids with nursual structures may be a positive phenotype in plants used for foods. In addition, it may be desirable to eliminate expression of TAGL genes for certain applications. TAGL enzymes may also be used a for formal accessing of plant seed oils. The TAGL enzymes can also be used as targets to facilitate the cells in a hearthcides. This is desirable because inhibition of the arymes could nay the anymes could hard to an inhibition of the arymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful as herbicides. This is desirable because inhibition of the activity of either of the enzymes could lead to an inhibition of plant growth. The polynucleotides also serve as a source of probes and primers, which are useful for genetic mapping, as markers for traits linked to those genes, and to isolate homologous sequences from other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    164 GGCCTCTGCGACCAGCTGCTCCTGCCACTCGGCTACCCTGCACGAGCACAACGTTGAA 223

                                                                                                                                                                                          The invention relates to novel genes (AAI93926-AAI97963) expressed in human neuroblastoma. The nucleic acids are applicable as a probe or primer in diagnosing the prognosis of human neuroblastoma, malignancy an susceptibility indicators or tumour markers for anti-cancer agents. The gene information for diagnosing prognosis is related to factors similar to that for N-myc and TrKA genes.
                                       Nucleic acids originating in gene expressed in human neuroblastoma, useful as probe or primer in diagnosing prognosis of human neuroblastoma, malignancy and susceptibility indicator or tumour marker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       311 CAACATGGTCTTTTTCAGGGAGGAGACACATGGTTCATAAACTCTGGTGAGCAATCACTT 370

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN94855 in a tissue sample. The method of the invention has hepatotropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug efficacy and drug metabolism.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPPO

The present sequence is a nucleic acid encoding kid goat pregastric esterase (kPGE, see ABB76189). kPGE free of other goat proteins can be produced by purification from the kid gullet or by recombinant expression in a non-kid cell, especially an Escherichia coli, expression in a non-kid cell, especially an Escherichia coli.

Caccharomyces cerevisiae (NRRL Y-30030) or CHO cell (all claimed). kPGE may be produced with an N-terminal polyHis-enterokinase sequence, which increases kPGE expression. The kPGE can be used to treat animals with an esterase or lipase deficiency. The enzyme produces a mixture of fatty acids when reacted with a dairy product, such as lipolysed butter oil, milk, cheese or whey. It is therefore useful in the production of enzyme modified cheeses as a substitute for rennet, and in the creation of flavour in cheese foods or any other food containing tridlycerides. Microbial production will allow the development of new Kosher and vegetarian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    An isolated kid goat pregastric esterase free from other goat proteins is useful to prepare enzyme modified cheese and to treat animals with an esterase or lipase deficiency \,\cdot\,

                        transform a host cell, such as Saccharomyces cerevisiae, for recombinant production of kPGE. The recombinant kPGE can be used to treat animals with an esterase or lipase deficiency. The enzyme produces a mixture of faty acids when reacted with a dairy product such as lipolysed butter oil, milk, cheese or whey. It is therefore useful in the production of enzyme modified cheeses as a substitute for rennet, and in the creation of flavour in cheese foods or any other food containing triglycerides. Microbial production will allow the development of new Kosher and vegetarian

                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a purified human lysosomal acid lipase
Dolypeptide. Also included are the polynucleotide encoding the
lipase (or its fragment, derivative, allete or sequence at least 60%
defection into it), vectors, host cells, a reagent (e.g. an antisense oligonucleotide) which binds to the lipase or polynucleotide (used for detection and modularing/reducing the lipase activity) and an anti-lipase antibody. The lipase and polynucleotide are useful for identifying the lipase and polynucleotide are useful for identifying the interest and interest and polynucleotide are useful for createment of a disease such as lipid malabsorption illness, cystic fibrosis, alcoholism, heart disease, heart attack, wolman disease, cholesterol eater storage disease, brain injury, mood disorder, anxiety disease thought disorder, volition disorder, sleep disorder, neurogenic disorder, myopathic disorder, obscity, cancer, corroint obscruttive pulmonary disease (COPD), diabetes, cancer, anxiety disease (COPD), diabetes, cancer, anxiety disorder, adisorder, adisorder, adisorder, adisorder, actual disorder, adisorder, anxiety disease, parkinson's disease, context adisorder, actual nervous system disorder and anorexia, osteoarthritis, a central nervous system disorder and context and any parking disorder, and propriet and any parking disorder, only appropriate and anorexia, osteoarthritis, a central nervous system disorder and context and any parking disorder. The present sequence is the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         183 TCCTGCCACTCGGCTACCCCTGCACCGAGCACAACGTTGAAACAAAAGATGGATTCCTTT 242

polypeptide. Also included are the polymucleotide encoding the lipase (or its fragment, derivative, allele or sequence at least 60% identical to it), vectors, host cells, a reagent (e.g. an antisense oligonucleotide) which binds to the lipase or polymucleotide (used for detection and modulating/reducing the lipase activity) and an anti-lipase antibody. The lipase and polymucleotide are useful for identifying therapeutic agents that either increase or decrease the lipase activity. The identified agent, the lipase and polymucleotide are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; ss; gene; lysosomal acid lipase; lipid malabsorption illness; cystic fibrosis; alcoholism; heart disease; heart attack; wolman disease; brain hilury; mood disorder: anxiety disorder; thought disorder; volition disorder; sleep disorder; neurogenic disorder; myopathic disorder; cobesity; cancer; chronic obstructive pulmonary disease; diabetes; cardiovascular disorder; Alzheimer's disease; Parkinson's disease; peripheral nervous system disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel human lysosomal acid lipase polypeptide, useful for treating cancer, diabetes, obesity, chronic obstructive pulmonary disease, peripheral or central nervous system disorder or cardiovascular

The present invention relates to TANGO or INTERCEPT proteins and coding sequences (see ARF45121-F45136 and AAR45138-F45139 and AAB660857, AAB660864-B66083 and AAB66085). The TANGO/INTERCEPT proteins and coding sequences are useful for the treatment of neurological disorders, but as system (CNS) disorders, CNS-related disorders, focal nearly system (CNS) disorders, CNS-related disorders, focal neurological and cerebrovacular disorders. The CNS disorders include Alzheimer's disease, senile dementia, Huntington's disease, amyotrophic lateral sclerosis, Parkinson's, Gilles de la Tourette's syndrome, autonomic function disorders such as hypertension and sleep disorders, neuropsychiatric disorders, psychoactive substance use disorders, anxiety, and bipolar affective disorder.
                                                                                                                                                                                                                                                                                                                                                    TANGO and INTERCEPT nucleic acids, proteins, and antibodies, useful for screening assays and diagnostic assays and for the treatment of neurological diseases such as Alzheimer's, Parkinson's and Huntington's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AGCAATCACTTGGGTATATCCTTGCTGATAACGGTTTTGATGTTTGGATTGGGAATGTCC 419

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to polynuclectides encoding proteins CG122, CG179, CG695, CG121, CG162, CG175, GG153 and CG168 which are related to proteins involved in lipid metabolism and cardiovascular disease such as human apolipoproteins. Ilpases and ilpoprotein receptor proteins. These DNA and protein sequences are useful for treating or preventing disorders associated with apolipoproteins, lipases and lipoprotein receptor (ALLr) expression and for treating ilpid metabolism, cardiovascular diseases and thrombosis. Antibodies against these proteins are useful for determining the presence of or predisposition to a disease associated with altered levels of these sequences. ALLr polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them and cells expressing ALLr proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of this polypeptide. Vectors comprising these DNA and protein sequences are also useful for producing ALLr proteins. The nucleic acids and polypeptides of the invention are also useful for the treatment of occlusive cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diseases, myocardial infarction, cerebral ischaemia, angina, arterial thrombosis, coronary artery thrombosis and cerebral artery thrombosis or intracardiac thrombosis and stroke. The nucleotides of the invention are used in gene therapy. The present sequence is human CG162 (or C59)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding human apolipoproteins, lipases, and lipoprotein receptor polypeptides, useful for preventing diagnosing and treating lipiq metabolism disorders, thrombosis and cardiovascular diseases -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Goodrich R;

The invention relates to polynucleotides encoding proteins CG122, CG179, CG95, CG121, CG162, CG27, CG153 and CG168 which are related to proteins involved in lipid metabolism and cardiovascular disease such as human apolitoporoteins. Ilpases and lipoprotein receptor proteins. These DNA and protein sequences are useful for treating or preventing disorders associated with apolitoporoteins, lipases and lipoprotein receptor (ALLr) expression and for treating lipid metabolism, cardiovascular diseases and thrombosis. Antibodies against these proteins are useful for expression and for treating lipid metabolism, cardiovascular diseases and thrombosis. Antibodies against these proteins are useful for cardiovascular diseases and thrombosis. Antibodies against these proteins are useful for identifying a cuseful for identifying a disease associated with altered levels of these sequences. ALLr polypeptides are also useful for useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of this polypeptide. Vectors comprising these DNA and protein sequences are also useful for producing ALLr proteins. The nucleic acids and polypeptides of the invention are also useful for the treatment of occlusive cardiovascular thrombosis. Coronary artery thrombosis and cerebral artery thrombosis of the invention are used in gene therapy. The present sequence is human CG162 (or C59)
                                                                                                                                                                                                     Nucleic acids encoding human apolipoproteins, lipases, and lipoprotein receptor polypeptides, useful for preventing diagnosing and treating lipid metabolism disorders, thrombosis and cardiovascular diseases -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to TANGO or INTERCEPT proteins and coding sequences (see AAF45121-F45136 and AAR45138-F45139 and AAB66031-B66057, AAB66004-B660033 and AAB660085). The TANGO/INTERCEPT proteins and coding sequences are useful for the treatment of neurological disorders such as central nervous system (CNS) disorders, CNS-related disorders, focal brain disorders, global-diffuse cerebral disorders and other neurological and cerebrovascular disorders. The CNS disorders include Alzheimer's disease, senile dementia, Huntington's disease, amyotrophic lateral sclerosis, Parkinson's, Gilles de la Tourette's syndrome, autonomic function disorders such as hypertension and sleep disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TANGO and INTERCEPT nucleic acids, proteins, and antibodies, useful for screening assays and diagnostic assays and for the treatment of neurological diseases such as Alzheimer's, Parkinson's and Huntington's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   183 TCCTGCCACTCGGCTACCCCTGCACCGAGCACAACGTTGAAACAAAAGATGGATTCCTTT 242

The threshold for highest quality sequence is 20. Three-prime sequences, which are obtained with PolyTMix or T7 sequencing primer, are presented as the reverse complement. T7 sequencing primer, are presented as the reverse complement. High quality sequence stop: 573
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cordonnier-Pratt,M.-M., Gingle,A., Fang,G.C., Dean,R., Wing,R., Sudman,M. and Pratt,L.H.

Cont. Cont. Cont. Site. 1. ECORI; Site. 2: XNOI; Seeds were surface-sterilized, germinated and grown aseptically in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Roots were harvested. The tissue, total RNA, and poly(A) RNA were prepared, a cDNA library was made in the TJ Close lab (Choi, Close, Fenton) at the University of California, Riverside. The CDNA clones were in vivo excised to give pBluescript phagemids before normalization was carried out. The mass excision of phagemid library and normalization were done in HT Nguyen lab by D. Zhang at Texas Tech University. Normalization protocol used was that of Soares. Plasmid DNA preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."

Sequences have been trimmed to exclude PolyA, vector and regions below Phred quality 16. The threshold for high quality sequence is 20. Three-prime sequences, which are obtained with PolyTMix or T7 sequencing primer, are presented as the reverse complement. Seq primer: JEN REV High quality sequence stop: 572 POLYA-NO.

/note="Organ: Anthracnose-infected leaves from
/note="Organ: Anthracnose-infected leaves from
two-week-old sorghum plants 48 hr after inoculation;
Vector: pBluescript II from Lambda Zap II; Site_1: XhoI;
Site_2: EcoRI; Two-week-old sorghum plants (BTX 62)
cultivar) were infected with pathogen (isolate FRW42I of
Colletotrichum graminicola, which is a sorghum isolate).
RNA was prepared from infected leaves harvested from 45
seedlings (2 weeks old) exhibit juvenile resistant
reaction, which is an incompatible interaction. As they
grow older (4 weeks or older), plants resume susceptiblity
to anthracnose disease. The library was made from poly. A
RNA in the cloning vector lambda ZAP II. Clones to be
sequenced were prepared by mass excision. WARNING: While
most or all ESTs are expected to derive from the host
plant, no effort was made to eliminate ESTs deriving from

XhoI; Immature seeds, collected from pods ranging in age from 25 to 35 days after pollination, were harvested from greenhouse-grown plants. Seed were removed and separated from pod walls and immediately frozen in liquid nitrogen. Seeds throughout the age range were pooled for mRNA extraction. cDNA was prepared from polyA+ enriched RNA. The cDNA was directionally ligated into the Unizap XR vector from Stratagene and packaged using Gigapack III Gold packaging extracts. Plasmids containing cDNA inserts were excised from the recombinant lambda-Zap phage using Ex-assist helper phage and propagated in XLOIR cells."
                                                                                                                                                                                                                                                                           .;

/Glone_lib="Pathogen-infected compatible I (PICI)"
/fissue_type="Leaves"
/dev_stage="weak-old seedlings infected with
Colletorichum grammincola"
/note="weator: pBluescript II SK(-) from Lambda Zap II;
Site_1: XhoI; Site_2: EcoRI; Four-week-old sorghum
seedlings were sprayed with spore suspension prepared from
3-week-old FRM42I, a sorghum isolate of the anthracnose
pathogen Colletorichum grammincola. Inoculated plants
were kept in a 25 C dark growth chamber with 100% relative
humidity for 24 hr, followed by 12/12 hr of light/dark
cycle at 25 C with 90% relative humidity for another 24
hr. All leaves were harvested and quick frozen with liquid
nitrogen and stored in a -80 C freezer. The library was
made from poly-A RNA in the coloning vector lambda ZAP II.
Clones to be sequenced were prepared by mass excision.
WARNING: While most or all ESTs are expected to derive
from the host plant, no effort was made to eliminate ESTs
deriving from the pathogen."

//dione_inb="pathogon induced induced leaves from
//dione_corpan: Anthracnose-infected leaves from
two-week-old sorghum plants 48 ha feter inoculation;
Vector: pBluescript II from Lambda Zap II; Site_1: XhoI;
Site_2: EcoRI; Two-week-old sorghum plants (BTX 623
cultivar) were infected with pathogon (isolate FRM42I of
Collectrichum graminicola, which is a sorghum isolate).
RNA was prepared from infected leaves harvested from 45
seedlings 48 hours after inoculation. Note: young
seedlings 2 weeks old exhibit juvenile resistant
raction, which is an incompatible interaction. As they
grow older (4 weeks or older), plants resume susceptiblity
to anthracnose disease. The library was made from poly-A
RNA in the cloning vector lambda ZAP II. Clones to be
sequenced were prepared by mass exclaion. WARNING: While
most or all ESTs are expected to derive from the host

Sequences have been trimmed to exclude PolyA, vector, and regions
below Phred quality 16. The threshold for highest quality sequence
is 20. Three-prime sequences, which are obtained with PolyTMix or
T7 sequencing primer, are presented as the reverse complement.
Seq primer: T7

                                        Colletotitichum gramminicola"

Colletotitichum gramminicola"

Site_1: Xhoi; Site_2: EcoRi; Four-week-old sorghum
seedlings were sprayed with spore suspension prepared from
3-week-old FRM42I, a sorghum isolate of the anthracnose
pathogen Colletotitichum gramminicola. Inoculated plants
were kept in a 25 C dark growth chamber with 100% relative
humidity for 24 hr, followed by 12/12 hr of light/dark
cycle at 25 C with 90% relative humidity for another 24
hr. All leaves were harvested and quick frozen with liquid
nitrogen and stored in a -80 C freezer. The library was
made from poly A RNA in the cloning vector lambda ZAP II.
Clones to be sequenced were prepared by mass excision.
WARNING: While most or all ESTS are expected to derive
from the host plant, no effort was made to eliminate ESTS
deriving from the pathogen."

Sequences have been trimmed to exclude PolyA, vector and regions
below Phred quality 16. The threshold for high quality sequence is
20. Three-prime sequences, which are obtained with PolyTMix or T7
sequencing primer, are presented as the reverse complement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              999 GCTACGGTCATTTGCGTCCTCCCGCATTTGACCTAAGCAGCATACCAGAATCACTGCCCA 1058

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1, M. Patent No. 6417002

GENERAL INFORMATION:

APPLICANT: HOTLICK, Robert

TITLE OF INVENTION: METHOD FOR MAINTENANCE AND SELECTION OF EPISOMES

FILE REFERENCE: 0867/00905;

CURRENT APPLICATION NUMBER: US/09/249,585A

CURRENT FILING DATE: 1999-02-11

NUMBER OF SEQ ID NOS: 18

SOFTWARE: Patentin version 3.0
